

Urban Life Laboratory —— Self-service garden with free constructing spaces

The park is located in the industrial transformation area, connecting the surrounding communities, schools, commercial office areas and comprehensive service facilities, serving as a part of urban green network as well. Students with their families, artists, litterateur, agronomy and horticulture enthusiasts, industrial and commercial groups will participate in the construction of the park. They will also be volunteers, event organizers and participants of the park. It becomes the city information center and the life possibility exploration area.

Through free space reconstruction and self-service garden pattern, the design realizes the common participation and common construction of different groups. We try to set up basic space units with multi-type, flexible use and rebuildable construction, which can meet the multi-function in different times in daily life. In addition, all kinds of social groups and individuals can choose and reserve the park space according to their needs, adjust and reconstruct the space spontaneously to hold activities open to the public.

The historical culture of the match factory became the regional postcard. The production process of match sticks, matchboxes and matches will be integrated into the spatial image of the park space. Series of urban agriculture exhibition and experience are formed by combining the historical farmhouses of the site, as well, agronomy and flower art festivals are held here. Those who invest in the crowdfunding can get the activity benefits.
